Explore face recognition

Note To complete this lab, you will need an Azure subscription in which you have administrative access.

Computer vision solutions often require an artificial intelligence (Al) solution to be able to detect human faces. For example, suppose the retail company Northwind Traders wants to locate where customers are standing in a store to best assist them. One way to accomplish this is to determine if there are any faces in the images, and if so, to identify the bounding box coordinates around the faces.

To test the capabilities of the Face service, we'll use a simple command-line application that runs in the Cloud Shell. The same principles and functionality apply in real-world solutions, such as web sites or phone apps.

Create a Cognitive Services resource

You can use the Face service by creating either a Face resource or a Cognitive Services resource.

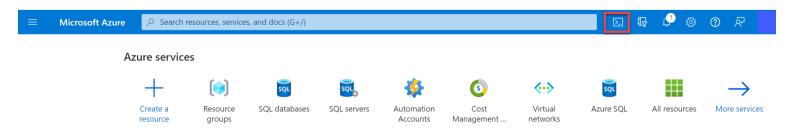

If you haven't already done so, create a Cognitive Services resource in your Azure subscription.

- 1. In another browser tab, open the Azure portal at https://portal.azure.com, signing in with your Microsoft account.
- 2. Click the **+Create** a **resource** button, search for *Cognitive Services*, and create a **Cognitive Services** resource with the following settings:
 - Subscription: Your Azure subscription.
 - Resource group: Select or create a resource group with a unique name.
 - Region: Choose any available region.
 - o Name: Enter a unique name.
 - Pricing tier: Standard S0
 - By checking this box I acknowledge that I have read and understood all the terms below:
 Selected.
- 3. Review and create the resource, and wait for deployment to complete. Then go to the deployed resource.
- 4. View the **Keys and Endpoint** page for your Cognitive Services resource. You will need the endpoint and keys to connect from client applications.

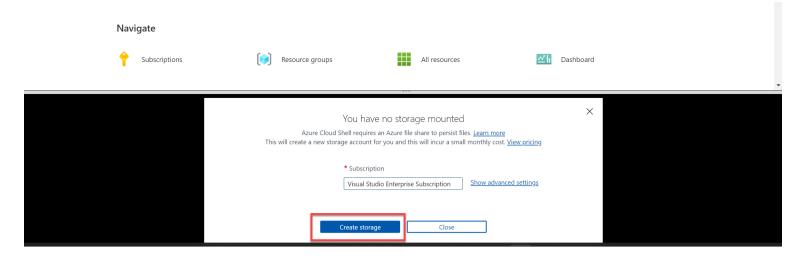

Run Cloud Shell

To test the capabilities of the Face service, we'll use a simple command-line application that runs in the Cloud Shell on Azure.

1. In the Azure portal, select the [>_] (Cloud Shell) button at the top of the page to the right of the search box. This opens a Cloud Shell pane at the bottom of the portal.

- 2. The first time you open the Cloud Shell, you may be prompted to choose the type of shell you want to use (*Bash* or *PowerShell*). Select **PowerShell**. If you do not see this option, skip the step.
- 3. If you are prompted to create storage for your Cloud Shell, ensure your subscription is specified and select **Create storage**. Then wait a minute or so for the storage to be created.

4. Make sure the type of shell indicated on the top left of the Cloud Shell pane is switched to *PowerShell*. If it is *Bash*, switch to *PowerShell* by using the drop-down menu.

```
Requesting a Cloud Shell.Succeeded.
Connecting terminal...

Welcome to Azure Cloud Shell

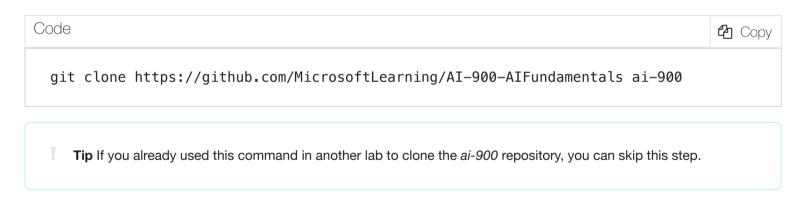

Type "az" to use Azure CLI
Type "help" to learn about Cloud Shell
```

5. Wait for PowerShell to start. You should see the following screen in the Azure portal:

Configure and run a client application

Now that you have a custom model, you can run a simple client application that uses the Face service.

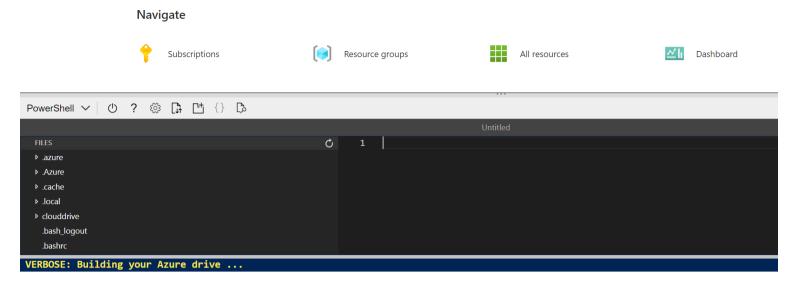

1. In the command shell, enter the following command to download the sample application and save it to a folder called ai-900.

2. The files are downloaded to a folder named **ai-900**. Now we want to see all of the files in your Cloud Shell storage and work with them. Type the following command into the shell:

Notice how this opens up an editor like the one in the image below:

3. In the **Files** pane on the left, expand **ai-900** and select **find-faces.ps1**. This file contains some code that uses the Face service to detect and analyze faces in an image, as shown here:

```
☼ Azure Cloud Shell
                                            $key="YOUR KEY"
 FILES
                               O
                                       1
                                            $endpoint="YOUR_ENDPOINT"
 ▶ .azure
 ▶ .Azure
 ▶ .cache
 ▶ .local
                                            # Code to call Face service for face detection
 ₄ ai-900
                                            $img_file = "store-camera-1.jpg"
  ▶ .git
                                            if ($args.count -gt 0 -And $args[0] -in ("store-cam")
  ▶ .github
                                                $img_file = $args[0]
  ▶ data
                                      11
    _build.yml
    _config.yml
                                            $img = "https://raw.githubusercontent.com/Microsoft
    analyze-image.ps1
    analyze-text.ps1
                                            $headers = @{}
                                            $headers.Add( "Ocp-Apim-Subscription-Key", $key )
    classify-image.ps1
                                            $headers.Add( "Content-Type", application/json" )
    detect-anomalies.ps1
    detect-objects.ps1
                                            $body = "{'url' : '$img'}"
    find-faces.ps1
    form-recognizer.ps1
                                            write-host "Analyzing image...`n"
    index.md
                                            $result = Invoke-RestMethod -Method Post `
    LICENSE
                                      23
                                                       -Uri "$endpoint/face/v1.0/detect?detectio
                                                       -Headers $headers
    mapping.md
                                                       -Body $body | ConvertTo-Json -Depth 5
    ocr.ps1
    readme.md
                                            $analysis = ($result | ConvertFrom-Json)
    speaking-clock.ps1
                                            foreach ($face in $analysis)
    translator.ps1
    understand.ps1
                                                Write-Host("Face location: $($face.faceRectangl)
```

4. Don't worry too much about the details of the code, the important thing is that it needs the endpoint URL and either of the keys for your Cognitive Services resource. Copy these from the **Keys and Endpoints** page for your resource from the Azure portal and paste them into the code editor, replacing the **YOUR_KEY** and **YOUR_ENDPOINT** placeholder values respectively.

```
Tip You may need to use the separator bar to adjust the screen area as you work with the Keys and Endpoint and Editor panes.
```

After pasting the key and endpoint values, the first two lines of code should look similar to this:

```
Code

$key="1a2b3c4d5e6f7g8h9i0j...."
$endpoint="https..."
```

5. At the top right of the editor pane, use the ... button to open the menu and select **Save** to save your changes. Then open the menu again and select **Close Editor**.

The sample client application will use your Face service to analyze the following image, taken by a camera in the Northwind Traders store:

6. In the PowerShell pane, enter the following commands to run the code:

```
Code

cd ai-900
./find-faces.ps1 store-camera-1.jpg
```

7. Review the returned information, which includes the location of the face in the image. The location of a face is indicated by the top-left coordinates, and the width and height of a *bounding box*, as shown here:

Note Face service capabilities that return personally identifiable features are restricted. See https://azure.microsoft.com/blog/responsible-ai-investments-and-safeguards-for-facial-recognition/ for details.

8. Now let's try another image:

To analyze the second image, enter the following command:

```
Code

./find-faces.ps1 store-camera-2.jpg
```

- 9. Review the results of the face analysis for the second image.
- 10. Let's try one more:

Create a
Cognitive
Services
resource

Run Cloud Shell

Configure and run a client application

Learn more

To analyze the third image, enter the following command:

```
Code

./find-faces.ps1 store-camera-3.jpg
```

11. Review the results of the face analysis for the third image.

Learn more

This simple app shows only some of the capabilities of the Face service. To learn more about what you can do with this service, see the <u>Face API page</u>.
